How can we go further with AI

over how can we be faster with AI

Better experience and guarantees over more functionality

Quality over quantity

Engineering over development

Formal specification and verification over natural language and testing

Artifact specification, reading,
selection, and review
over artifact writing

Explanation over it works, it's fast, it's secure, it scales, etc.

Semantics over syntax and technology

Understanding over contents

What and why over how

**SE fundamentals and principles
are essential for all that**

When and how to use LLMs (costs!)

SE for AI

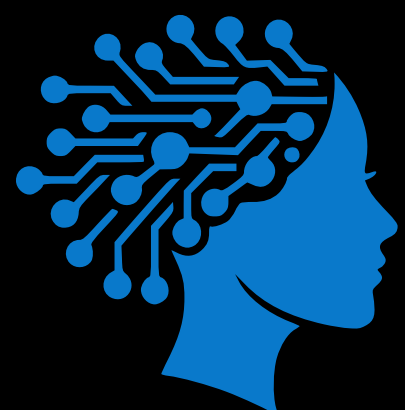

Working under uncertainty
